EDUCATION

BMS Institute of Technology & Management

Bachelor of Engineering - Computer Science Engineering; CGPA: 9.00

Bengaluru, India

Sept. 2023 – Present

EXPERIENCE

Software Engineering Extern

Dec 2025 – May 2026

Unisys

Remote

- Built a **Python (Flask) + PowerShell** system that autonomously **monitored Windows OS events** and applied rules-based corrections — designed end-to-end, from rule engine logic to deployment, with no existing framework to extend.
- Shipped a real-time **event-tracking dashboard** with severity classification and **remediation scheduling** — owned the full stack from backend logic to the operator-facing UI.
- Engineered an **automated logging pipeline processing** 10,000+ system events with metadata enrichment, applying structured data modelling for **scalable downstream analytics**.

PROJECTS

Subscription Tracker — Full-Stack Microservices Platform | *Express.js, PostgreSQL, Docker, Nginx, Jenkins CI/CD*

- Built and shipped a **full production-grade** application solo — migrated a serverless backend to a **containerised microservices architecture** coordinated via **Docker Compose**.
- Designed a **6-tier Jenkins CI/CD pipeline** (code analysis, security scanning, artifact staging) enabling **zero-touch deployment on every commit** — end-to-end ownership from infra to release.
- Built a **real-time analytics dashboard** (Chart.js) over PostgreSQL-backed billing data, exposed through **REST APIs** — full vertical slice from database to UI.

AutoRoadSense – Detection & Reporting of Hazards | *Python, YOLO, MiDaS, GPS Geo-tagging, GIS Dashboard*

- Built an **end-to-end computer vision pipeline** from scratch — YOLO-based object detection fused with MiDaS **monocular depth estimation** to detect and score road hazards from **raw dashcam footage**.
- Shipped a **real-time GIS dashboard** consuming pipeline output for **live hazard monitoring** — took the system from raw video input to a usable, deployed interface.
- Designed every stage (detection → depth → severity scoring → geo-tagging → storage → dashboard) as an **independently testable module** — no existing framework, built the architecture from zero.

RESEARCH PUBLICATIONS

Adversarial Regularization via Stackelberg Equilibria | *Python, PyTorch, Game Theory, Min-Max Optimization*

Under Review, Elsevier FGCS

- Architected a **Stackelberg game-theoretic pipeline** from scratch in PyTorch to simulate and defend deep neural networks against high-severity **clean-label data poisoning attacks**.
- Engineered an **iterative Min-Max retraining algorithm** with anticipatory warm-starting — proving both mathematically and empirically that existing anomaly filters fail under semantic data corruption.
- Discovered a novel **Adversarial Regularization effect**, suppressing backdoor Attack Success Rates to just 3.53% while forcing the defended model to **outperform a pristine, unpoisoned baseline by +4.54%**.

CERTIFICATIONS / ACHIEVEMENTS

- SAP Backend Developer (CAP)** | 2026: Hands-on backend dev with OData services & REST APIs on SAP BTP.
- SAP Business Data Cloud** | 2026: Certified in enterprise data architecture, cloud-based analytics pipelines, and data governance frameworks.
- 3rd Place, UI/UX Design Ideathon** | May 2025: Designed and built a high-fidelity Figma prototype replicating the IKS Health platform
- Social Media & Design Head, AWS Student Builder Group, BMSITM** | Nov 2025 – Present: Led end-to-end design operations and cross-functional coordination for the college's AWS community chapter.

TECHNICAL SKILLS

Programming Languages: C++, C, Python, Java, JavaScript

Full-Stack: React, Express.js, Node.js, Flask, REST APIs, HTML, CSS

AI / ML: LLMs, RAG, AI Agents, Prompt Engineering, Computer Vision (YOLO, MiDaS), Federated Learning

Databases: PostgreSQL, MySQL, MongoDB, Firebase Firestore

DevOps: Docker, Docker Compose, Jenkins CI/CD, Nginx, Git, GitHub, Linux
